

Solids Retention Structure at Water Pollution Control Plant NOTICE OF PROJECT COMMENCEMENT

The Municipality of Brighton (Municipality) is proceeding with the construction of a solids retention structure (berm) in one of the existing lagoons at the Water Pollution Control Plant (WPCP). Currently, treatment of sewage at the WPCP occurs through an aerated lagoon, chemical phosphorus removal, a facultative lagoon (stabilization pond), and a constructed treatment wetland.

The Municipality is proposing to construct a berm (an earthen barrier made of clay and crushed stone) in the lagoon to create a solids holding area within the existing lagoon. This new structure will facilitate maintenance activities, such as the removal of solids, and will allow for temporary containment of solids during certain times of the year, which may also help reduce the concentration of ammonia entering Presqu'île Bay. The berm will be equipped with a gate to allow for flow diversion under different operating scenarios.

This project is "pre-approved" under the Municipal Engineers Association's Municipal Class Environmental Assessment process (June 2000, amended in 2007). The Municipality wishes to notify the public of its intention to proceed with this project.

Construction of the berm is estimated to commence in late summer 2010. It is expected the project construction will last approximately 2 months. If you have questions or comments regarding the project, please contact:
